This SOP outlines the steps required to scan a single color job when using the Intellitrax Scanner.

1. Ensure that the press sequence is setup to contain only the colour that you are running. For example; if using a 6C colour bar and only printing Black, assign K to the appropriate unit and set all other units to NC (No Color).
2. Under the Scanner pull down menu, select Set Scanner Colors. The following window will appear:

If only printing K, make sure that all of the other colours (CMY and all Specials) have been assigned a paper value as the above graphic indicates.

3. At this point, the sheet can be placed in the scanner and then the Find Bar button should be pressed. The scanner should read the colour bar properly. If not, try setting the colour bar coordinates manually using the Set Bar feature.
